

Homan Engineering- NZTTMF Member Since: 2017

At Homan Engineering Services, transport manufacturing is firmly focussed on building premium quality vehicle bodies, both standard and custom builds.

Standard builds include tipping decks, bath tub tippers, flat decks, box bodies, curtainsiders, and skeletal. Custom builds comprise service vehicle bodies, tyre fleet service bodies and crane trucks.

In addition to the builds, the company offers its transport clients certified tow bars, draw bars and draw beams, trailer hydraulics, tail lift fitting, mounting of truck-mounted cranes, and set up of trailer units. Homan clients have the advantage of previewing their requirements in realistic computer-generated 3D image before the build begins.

In fact, diversity is the cornerstone of the Homan business. Owners Luke and Vanessa Homan have invested heavily in design software and training. Luke Homan leads the design process combining his first-hand experience and knowledge of manufacturing and the transport industry and the result is the ability to meet any design challenge. They see themselves, essentially, as solution providers.

Homan Engineering Services is efficient and wholly professional service provider to the transport sector. Those are all dynamics the sector expects. But what Homan Engineering Services adds to the mix is the personal service. Luke Homan is very much a hands-on owner and manager. He is there at the beginning of the build and continues to manage and guide his strong team through every aspect of the build through to fruition.
